The parking lot

Eight new features, written down so they stop being re-invented — and deliberately **not** added to the queue. `BACKLOG.md` holds nineteen items with pass criteria; this file holds the ones that have a case but not yet a reason to be next. One of the eight has since been rejected outright by the owner, which is the other thing this file is for.

The rule is one line: **an idea leaves this file only by replacing something in the queue.** A parking lot that grows is a second backlog, and a second backlog is how the first one stopped being read.

What was measured before writing any of it

Each idea was checked against the fork, in the direction that matters: does the capability exist already, under another name?

Supposed gap	What the search actually found	Verdict
A bridge to another chat network	`discord` appears in two places: guild-template import, and an unrelated certificate name. `relay` is 111 files of **upload relay**	genuinely absent
Mail arriving in a channel	zero files for any inbound-email path	genuinely absent
Guest access	five hits, all meaning "an unclaimed account is a guest", not a read-only visitor	genuinely absent
Messages revealed at a date	zero hits for `reveal_at`, `unlock_at`, "time capsule"	genuinely absent
Watchwords	zero hits for `watchword`, `savedSearch`	genuinely absent
A message as a shareable image	twelve hits, all the screen-share picker and image-preview fields	genuinely absent
Quiet hours on a schedule	zero hits for `quietHours`, `DoNotDisturb`	genuinely absent
A public reading page	no exportable thread surface; "blog" and "public" are unrelated	genuinely absent

All eight are real gaps rather than already-shipped features wearing different words. That is the only reason they are written at all.

1. ~~A bridge to where your friends already are~~ — rejected

One channel relayed to Discord and back, with names preserved and loops prevented.

The owner declined this on 13 November 2026, and it is now a never rather than a park. The reason is not technical: the messages would leave a server he owns and land under someone else's terms, and the invitation is the thing he actually wants to work — not a bypass around it.

The full analysis stays on file as `PLAN-BRIDGE.md`, banner-marked as rejected, so the idea is not re-proposed in six weeks with a fresh coat of paint.

2. Mail that lands in a channel

An address per channel — `general@wizardry.slothlee.xyz` — so a letter written by email appears as a message, with the sender as the author.

- **Why it fits:** the tagline is about slow talk, and email is the slowest channel that already works. The mail server is already yours and already relays for this domain.
- **Cost:** medium-high: an inbound SMTP handler, address routing, spoofing rules (DMARC is already `p=reject`), and an attachment path.
- **What it must not become:** a way to post as someone else. A message from mail is labelled as having come by mail, with the address it came from.
- **Falsifier:** if no one sends a letter in a month, the feature was a clever idea about email rather than a need.

3. Guest access: look before joining

An invite that opens the guild read-only, with a join button, so an invitation can be a visit rather than a decision.

- **Why it fits:** the front door is closed and the invitation is the only way in. Letting someone read the room first makes that invitation much easier to accept.
- **Cost:** medium: a role with no write permission, an expiry, and a clear marker that the visitor is a visitor.
- **What it must not become:** a public archive. A guest link expires, always.
- **Falsifier:** if guests never convert to members, the visit was the product, and a static page would have done.

4. Time capsules

A message sealed until a date, then revealed to the channel.

- **Why it fits:** it is the only feature in this file that is purely for the pleasure of the place, and "talk slowly" tolerates a message that arrives in a year.
- **Cost:** low-medium: a hidden-message flag, a scheduled reveal job, and an honest "sealed on" state. The job ledger already exists.
- **What it must not become:** a way to say something without ever being accountable for it. A capsule names its author when it opens.
- **Falsifier:** if nobody seals one in the first month, it is a demo, not a feature.

5. Watchwords

"Tell me when someone says this" — a phrase, a name, a channel, and a quiet notice when it appears.

- **Why it fits:** the index will exist after Q3, and this is the cheapest useful thing to build on top of it. It also gives a reason to open the app without being pinged.
- **Cost:** medium: a stored query per person, a per-message check, and a delivery that is a digest rather than a ping.

- **What it must not become:** surveillance. A watchword sees messages you can already read, and nothing else.
- **Falsifier:** if it fires more than a few times a week, people mute it and it was a filter, not a feature.

6. Postcards

Render a message, or three, as an image worth sending to someone who is not in the room.

- **Why it fits:** every other idea keeps the conversation inside; this one lets a good exchange leave, carrying the mascot and the name with it.
- **Cost:** medium: a client-side render, a typographic layout that survives a phone, and a rule about what a postcard may contain.
- **What it must not become:** a screenshot tool for arguments. A postcard carries the message and the names the people involved already chose to publish.
- **Falsifier:** if nobody sends one out, the room prefers being private and that is an answer.

7. Quiet hours

A window each person sets — say 22:00 to 08:00 — in which nothing pings, and a message that arrived overnight is waiting in the morning.

- **Why it fits:** wave six made the room quiet by default; this makes it quiet by schedule, which is the version people actually need.
- **Cost:** low: a per-user window, checked where notifications are already decided.
- **What it must not become:** a reason a message is silently dropped. The queue is visible.
- **Falsifier:** if nobody sets a window, mentions-only was enough and this is decoration.

8. The reading garden

Chosen threads, exported to a page anyone can read, at `wizardry.slothlee.xyz/garden`.

- **Why it fits:** it is the only idea here that could make the place interesting to people who will never join.
- **Cost:** high: selection, redaction, a renderer, and the whole problem of consent for a conversation written in private.
- **What it must not become:** publishing by default. Nothing leaves the instance without the author of every message in the thread agreeing.
- **Falsifier:** it should not be built until there are threads worth reading, which is Q15 and a year of talking. **Never, until then.**

What could jump the queue now

Nothing. The one candidate — the bridge — was the only idea here that changed *why* anyone would come, and the owner has declined it.

What remains is seven ideas that improve the room for people already in it, and the queue in `BACKLOG.md` already orders those. That makes this file what it should be: a record of what was considered and why, not a second place to look for the next thing to build.

The count, again

Thirty-two distinct items, six built, nineteen queued, seven buried — and now seven parked and one rejected, which makes forty. Nothing here is scheduled. If `BACKLOG.md`'s Q1 to Q4 are still unbuilt when this file is next opened, the correct response is to delete three ideas from it at random, not to add another: an idea that has survived a month of not being built is usually not waiting for its turn, it is waiting to be let go.
